CS 630 Project One: Test Execution – Excelon Development

Execution Scope and Testing Units

Execution was organized into small, traceable units rather than one broad statement that the website was “tested.” Each unit had a charter, expected result, evidence target, and release consequence. This structure supports reproducibility and defect triage. The live site exposes primary paths for Testing, Placement, Writing, Consulting, Software, Blog, About, Training, Publications, and Contact. The home page also presents service summaries and calls to action. Excelon describes its own testing approach as risk-oriented and context-driven, which makes charter-based exploratory testing particularly appropriate for this evaluation (Excelon Development, 2026).

Unit	Charter / Goal	Risk
S1 – Core navigation	Tour primary and secondary navigation; look for dead ends, wrong destinations, duplicated/confusing labels, or missing recovery paths.	High
S2 – Service discovery	Act as a prospective client comparing Testing, Placement, Writing, Consulting, and Software; determine whether service purpose and next action are clear.	High
S3 – Content/search	Act as a visitor seeking recent thought leadership; verify Blog/Publication discovery and representative content.	Medium
S4 – Contact/conversion	Follow calls to action toward Contact/Work with Excelon; identify barriers that could prevent a lead from continuing.	High
S5 – UX/compatibility	Review responsive, accessibility-oriented, browser, and reliability concerns; record any unexecuted environment as residual risk.	High

Executed Test Cases and Results

ID	Test	Expected	Observed	Status
TC-01	Home page loads and presents company/service purpose.	Homepage reachable; service summaries visible.	Homepage reachable; Testing, Placement, Writing and company positioning visible.	Pass
TC-02	Open Testing from primary navigation.	Testing page loads with relevant service content and contact path.	Testing page reachable; testing/risk-management content and Contact Excelon path present.	Pass
TC-03	Open Placement.	Placement content loads and describes recruiting/contract staffing.	Placement page content was discoverable and described recruiting/contract staffing.	Pass
TC-04	Open Writing.	Writing content loads with service description and recent publications.	Writing page reachable; writing services and recent publication entries visible.	Pass
TC-05	Open Consulting.	Consulting content loads and provides a contact path.	Consulting page reachable; scope, delivery/support information and Contact Excelon path visible.	Pass
TC-06	Open Software/custom software.	Software service content is reachable and explains development offering.	Custom software content was discoverable and described web/mobile/cloud/integration work.	Pass
TC-07	Open Blog and inspect recency.	Blog index loads and exposes readable, dated posts.	Blog index reachable; recent 2026 and 2025 entries were listed.	Pass
TC-08	Inspect About/Team discovery.	Visitors can reach credibility/background information.	About and Meet the Team paths were exposed in site navigation.	Pass

TC-09	Inspect footer/secondary navigation.	Footer provides recovery paths and no obvious navigation dead end.	Footer exposes Work with Excelon, About Excelon, Contact, and secondary navigation.	Pass
TC-10	Review page-label consistency.	Labels should be clear and avoid unnecessary duplication/confusion.	Homepage repeats service blocks for Testing/Placement/Writing; functional but visually/content-wise redundant.	Observation
TC-11	Inspect image semantics from retrievable page structure.	Important images should have meaningful alternatives where needed.	Several homepage client images are exposed generically as "Image" in retrievable structure; requires browser/accessibility-tree confirmation.	Open
TC-12	Cross-browser/mobile visual smoke.	Critical layout/menu/contact journeys remain usable in Chrome, Safari, Firefox/Edge, phone/tablet.	Not fully reproducible in the available execution environment; retained as release risk and mandatory pre-PR check.	Not executed

Observed Bugs, Anomalies, and Test Log

No Critical or High-severity functional defect was confirmed in the live paths that were executed. The strongest finding is therefore not a fabricated failure but a set of quality observations and residual risks. First, the home page presents Testing, Placement, and Writing summaries more than once. This does not break functionality, but it may create unnecessary repetition for first-time visitors. Second, several featured-client image elements are represented generically in the retrievable page structure, so meaningful alternative text should be verified in a browser's accessibility tree before launching. Third, full cross-browser/mobile visual behavior

could not be conclusively demonstrated in the available execution environment and remains in an explicit coverage gap.

Log	Activity	Outcome
10:00–10:30	Scope/entry check; homepage and primary navigation inventory	Site reachable; core paths identified.
10:30–11:20	S1 navigation + S2 service discovery	Primary service pages reachable; no confirmed blocking dead end.
11:20–11:50	S3 blog/content review	Blog and dated content discoverable.
11:50–12:20	S4 conversion/contact-path review	Contact calls to action present on service pages.
12:20–12:45	S5 structural accessibility/reliability review	Potential image-alt concern; visual cross-browser coverage incomplete.
12:45–13:00	Triage and completion review	0 Critical, 0 High confirmed; observations/risks documented.

Execution Assessment

The executed evidence supports a provisional pass for core information architecture and service discovery. However, “pass” does not mean defect-free. The evidence is strongest for live page reachability, content discovery, and navigation structure, and weaker for device-specific rendering, keyboard behavior, and measured performance. Those limitations are carried forward into the release of recommendation rather than being treated as successful tests. This approach follows good QA reporting practice: a report should communicate meaningful status and risk, not merely the number of cases executed (Beregnaya, 2020).
